Assume that  $X = \{x_1, \dots, x_g\}$  is a finite alphabet and  $\mathbf{k}$  is a field. We study the class  $\mathfrak{C}(X, W)$  of associative graded  $\mathbf{k}$ -algebras  $A$  generated by  $X$  and with a fixed obstructions set  $W$  consisting of Lyndon words in the alphabet  $X$ . Important examples are the monomial algebras  $A = \mathbf{k}\langle X \rangle / (W)$ , where  $W$  is an antichain of Lyndon words of arbitrary cardinality and the enveloping algebra  $U\mathfrak{g}$  of any  $X$ -generated Lie  $\mathbf{k}$ -algebra  $\mathfrak{g} = \text{Lie}(X) / ([W])$ , whenever the set of standard bracketings  $[W] = \{[w] \mid w \in W\}$  is a Groebner-Shirshov Lie basis. We prove that all algebras  $A$  in  $\mathfrak{C}(X, W)$  share the same Poincaré-Birkhoff-Witt type  $\mathbf{k}$ -basis built out of the so called *Lyndon atoms*  $N$  (determined uniquely by  $W$ ) but, in general,  $N$  may be infinite. Moreover,  $A$  has polynomial growth if and only if the set of Lyndon atoms  $N$  is finite. In this case  $A$  has a  $\mathbf{k}$ -basis  $\mathfrak{N} = \{l_1^{\alpha_1} l_2^{\alpha_2} \cdots l_d^{\alpha_d} \mid \alpha_i \geq 0, 1 \leq i \leq d\}$ , where  $N = \{l_1, \dots, l_d\}$ . Surprisingly, in the case when  $A$  has polynomial growth its global dimension does not depend on the shape of its defining relations but only on the set of obstructions  $W$ . We prove that if  $A$  has polynomial growth of degree  $d$  then  $A$  has global dimension  $d$  and is standard finitely presented, with  $d-1 \leq |W| \leq d(d-1)/2$ . We study when the set of standard bracketings  $[W] = \{[w] \mid w \in W\}$  is a Groebner-Shirshov Lie basis. We use our general results to classify the Artin-Schelter regular algebras  $A$  generated by two elements, with defining relations  $[W]$  and global dimension  $\leq 7$ .
